## Summary

International trade is a significant threat to wildlife globally (Bennett et al., 2002; Bush, Baker, & Macdonald, 2014; Lenzen et al., 2012; Tingley, Harris, Hua, Wilcove, & Yong, 2017). Consequently, high-quality, widely accessible data on the wildlife trade are urgently needed to generate effective conservation strategies and action (Joppa et al., 2016). The [Convention on International Trade in Endangered Species of Wild Fauna and Flora](#) (CITES) provides a key wildlife trade dataset for conservationists, the CITES Trade Database, which is maintained by the [UN Environment World Conservation Monitoring Centre](#). Broadly, CITES is a trade oversight mechanism which aims to limit the negative effects of overharvesting, and the CITES Trade Database represents compiled data from CITES Parties regarding the trade of wildlife or wildlife products listed under the CITES Appendices. Despite data complexities that can complicate interpretation (Berec, Vrščeká, & Šetlíková, 2018; Eskew, Ross, Zambrana-Torrel, & Karesh, 2019; Harrington, 2015; Lopes, Ferreira, & Moraes-Barros, 2017; J. E. Robinson & Sinovas, 2018), the CITES Trade Database remains a critically important resource for evaluating the extent and impact of the legal, international wildlife trade (Harfoot et al., 2018).

`citesdb` is an R package designed to support analysis of the recently released shipment-level CITES Trade Database (UNEP-WCMC, 2019). Currently, the database contains over 40 years and 20 million records of shipments of wildlife and wildlife products subject to reporting under CITES, including individual shipment permit IDs that have been anonymized by hashing, and accompanying metadata. Harfoot et al. (2018) provide a recent overview of broad temporal and spatial trends in this data. To facilitate further analysis of this large dataset, the `citesdb` package imports the CITES Trade Database into a local, on-disk embedded database (Raasveldt & Mühleisen, 2018). This avoids the need for users to pre-process the data or load the multi-gigabyte dataset into memory. The MonetDB back-end allows high-performance querying and is accessible via a DBI- and `dbplyr`-compatible interface familiar to most R users (R Special Interest Group on Databases (R-SIG-DB), Wickham, & Müller, 2018; Wickham, François, Henry, & Müller, 2019). For users of the RStudio integrated development environment (RStudio Team, 2015), the package also provides an interactive pane for exploring the database and previewing data. `citesdb` has undergone [code review at rOpenSci](#).
